Diagnostic Error Analysis & Biological Confusion Report

Project: AI-Powered Crop Pest Prediction | Date: 2026-10-05 | Agricultural AI Expert

1. Objective & Taxonomic Diagnostics

This diagnostic analysis isolates the primary confusion clusters across the 25 pest species and explains the biological, morphological, and climatic reasons underlying model misclassifications.

2. Top Confused Pest Species Pairs

True Pest Species	Confused Prediction	Common Crop Host	Biological Rationale
Aphid	Mustard Aphid	Mustard / Gram	Both are small phloem-sucking Hemipteran aphids sharing identical thermal and moisture niches.
Fall Armyworm	Spodoptera	Maize / Cotton	Both are closely related Noctuid leaf-eating armyworms flourishing during late monsoon vegetative stages.
Early Shoot Borer	Top Borer	Sugarcane	Both are Pyralid stem caterpillars attacking sugarcane whorls under identical humidity conditions.
Pod Borer	Gram Pod Borer	Pulses / Gram	Both attack developing seed pods during reproductive flowering phases with overlapping NPK ratios.
Leaf Folder	Stem Borer	Rice	Both are major Lepidopteran rice pests peaking during high-humidity tillering stages.

3. Mitigation Tactics & Field Advisory Safety

Because biological sister species share identical active chemical controls (e.g. Chlorantraniliprole for caterpillars, Neem Oil/Acetamiprid for aphids), Top-3 candidate presentation ensures that the recommended pesticide and cultural controls remain therapeutically effective even in boundary cases.
